

AI Engineer Intern Assignment

Problem statement: Build a tool that automatically creates high-quality, RAG-ready chunks from raw PDFs.

Instructions: You have 2 days. You may send follow-up emails with any clarifying questions.

Setup: You will receive about 7 PDFs on a similar theme, varying in length and formatting. Your task is to develop a single chunking pipeline that works across all PDFs, enabling a RAG system to retrieve relevant context even when answers require information from multiple PDFs. Chunks should be self-contained, minimally repetitive, and clean for indexing. Explain your choices clearly: what you tried, what you selected, and why.

Evaluation: This assignment tests practical skills and collaboration, as we assess if we'd enjoy working together. We seek a practical, end-to-end solution reliable for retrieval. We value your approach over a "perfect" method. We will evaluate how you ask questions, test assumptions, iterate within two days, explain trade-offs clearly, and whether your final output demonstrates strong technical judgment, clear communication, and attention to detail.
